CHAPTER 5

SECTION 5.2: CONSTANT COEFFICIENT HOMOGENEOUS EQUATIONS

CONTENTS

What is a Constant Coefficient Homogeneous ODE?	2
Distinct Real Roots: $\sqrt{b^2 - 4ac} > 0$	3
Repeated Roots: $\sqrt{b^2 - 4ac} = 0$	4
Complex Roots: $\sqrt{b^2 - 4ac} < 0$	6
Complex Numbers	6

WHAT IS A CONSTANT COEFFICIENT HOMOGENEOUS ODE?

We restrict even further the second order ODE. A **second order constant coefficient ODE** is an ODE of the form

$$ay'' + by' + cy = f(x) \tag{1}$$

where a, b, c are fixed numbers and f is a continuous function.

Goal:

Find the solutions to

$$ay'' + by' + cy = 0.$$

We call this the **constant coefficient homogeneous ODE**.

Trick:

DISTINCT REAL ROOTS: $\sqrt{b^2 - 4ac} > 0$

EXAMPLE 1. Find the general solution of

$$y'' + 6y' + 5y = 0.$$

General Fact:

- If the roots of the characteristic polynomial are r_1 and r_2 , then $y_1(x) = e^{r_1x}$ and $y_2 = e^{r_2x}$ are solutions to the ODE.
- The general solutions is given by

$$y(x) = c_1e^{r_1x} + c_2e^{r_2x}.$$

REPEATED ROOTS: $\sqrt{b^2 - 4ac} = 0$

EXAMPLE 2.

a) Find the general solution of

$$y'' + 6y' + 9y = 0.$$

b) Solve the following IVP:

$$y'' + 6y' + 9y = 0, \quad y(0) = 3, \quad y'(0) = -1.$$

General Facts:

- If the root of the characteristic polynomial is r_1 , then $y_1(x) = e^{r_1 x}$ and $y_2(x) = xe^{r_1 x}$ are solutions to the ODE.
- The general solution is given by

$$y(x) = e^{r_1 x}(c_1 + c_2 x).$$

EXAMPLE 3.

a) Find the general solution of

$$y'' + 4y' + 13y = 0.$$

b) Solve the following IVP:

$$y'' + 4y + 13y = 0, \quad y(0) = 2, y'(0) = -3.$$

Complex Numbers

A complex number is an expression of the form

$$z = \alpha + i\beta$$

where α, β are real numbers and $i^2 = -1$ ($i = \sqrt{-1}$).

Consider $z = \alpha + i\beta$ and $w = \gamma + i\mu$.

- $z = w$ if and only if $\alpha = \gamma$ and $\beta = \mu$.
- $zw = (\alpha\gamma - \beta\mu) + i(\alpha\mu + \beta\gamma)$.
- $z + w = (\alpha + \gamma) + i(\beta + \mu)$.
- $z/w = \frac{(\alpha+i\beta)(\gamma-i\mu)}{(\gamma+i\mu)(\gamma-i\mu)}$, if $w \neq 0$.

EXAMPLE 4. If $z = 1 + i$ and $w = 1 - i$, find

- a) $z + w$. b) zw . c) z/w .

EXAMPLE 5. Complete the previous example.

General Facts:

- If $r_1 = \alpha + \beta i$ and $r_2 = \alpha - \beta i$ are the roots of the characteristic polynomial, then $y_1(x) = e^{\alpha x} \cos(\beta x)$ and $y_2(x) = e^{\alpha x} \sin(\beta x)$ are solutions to the ODE.
- The general solution has the form

$$y(x) = e^{\alpha x}(c_1 \cos(\beta x) + c_2 \sin(\beta x)).$$
